# 1 Project Overview

LearnTrack is a polyglot Big Data analytics platform designed to analyze student activities in online learning systems.

The platform provides:

- Real-time engagement scoring
- Multi-region access detection
- Batch analytics at course level
- Interactive dashboards

Technologies used: MongoDB, Redis, Neo4j, Apache Spark, Cassandra, and Grafana.

## 2 Docker Network Creation

All containers communicate through a shared Docker network.

```
1 docker network create learntrack-net
```

## 3 MongoDB Setup

### 3.1 Run MongoDB Container

```
1 docker run -d \  
2   --name mongo \  
3   --network learntrack-net \  
4   -p 27017:27017 \  
5   mongo
```

### 3.2 Insert Sample Data

```
1 docker exec -it mongo mongosh
```

```
1 use learntrack  
2  
3 db.activities.insertMany([  
4   { studentId:"S7", courseId:"C1", action:"page_view", timestamp:new  
5     Date(), region:"AF" },  
6   { studentId:"S7", courseId:"C1", action:"page_view", timestamp:new  
7     Date(), region:"EU" },  
8   { studentId:"S9", courseId:"C3", action:"quiz_attempt", timestamp:new  
9     Date(), region:"US" }  
10  ])  
11  
12 db.activities.find().pretty()
```

## 4 Redis Setup (Python Script Execution)

### 4.1 Run Redis Container

```
1 docker run -d \  
2   --name redis \  
3   --network learntrack-net \  
4   -p 6379:6379 \  
5   redis
```

### 4.2 Execute Redis Python Loader

Redis engagement scores are computed using the Python script `redis_loader.py`, which reads activity data from MongoDB and stores aggregated scores in Redis.

```
1 docker exec -it spark bash
```

```
1 python /opt/spark/work-dir/redis_loader.py
```

### 4.3 Verify Redis Scores

```
1 KEYS student*:score  
2 GET student:S7:score  
3 MGET student:S7:score student:S9:score
```

## 5 Neo4j Setup (Python Script Execution)

### 5.1 Run Neo4j Container

```
1 docker run -d \  
2   --name neo4j \  
3   --network learntrack-net \  
4   -p 7474:7474 \  
5   -p 7687:7687 \  
6   -e NEO4J_AUTH=neo4j/password \  
7   neo4j:5
```

### 5.2 Execute Neo4j Python Loader

The graph database is populated using the Python script `neo4j_loader.py`, which loads activities from MongoDB into Neo4j.

```
1 docker exec -it spark bash
```

```
1 python /opt/spark/work-dir/neo4j_loader.py
```

### 5.3 Verify Graph in Neo4j Browser

Open:

<http://localhost:7474>

```
1 MATCH (s:Student)-[:PERFORMED]->(a:Activity)-[:IN_REGION]->(r:Region)  
2 RETURN s, a, r;
```

## 5.4 Multi-Region Access Detection

```
1 MATCH (s:Student)-[:PERFORMED]->(a1)-[:IN_REGION]->(r1),
2      (s)-[:PERFORMED]->(a2)-[:IN_REGION]->(r2)
3 WHERE r1.name <> r2.name
4       AND duration.between(a1.timestamp, a2.timestamp)
5          < duration({minutes:30})
6 RETURN s.id AS studentId,
7        collect(DISTINCT r1.name) + collect(DISTINCT r2.name) AS regions
      ;
```

## 6 Cassandra Setup

### 6.1 Run Cassandra Container

```
1 docker run -d \
2   --name cassandra \
3   --network learntrack-net \
4   -p 9042:9042 \
5   cassandra:4
```

### 6.2 Create Keyspace and Table

```
1 docker exec -it cassandra cqlsh
```

```
1 CREATE KEYSPACE learntrack
2 WITH replication = {'class':'SimpleStrategy','replication_factor':1};
3
4 USE learntrack;
5
6 CREATE TABLE course_engagement (
7   courseid text,
8   date date,
9   count int,
10  PRIMARY KEY (courseid, date)
11 );
```

## 7 Apache Spark Batch Processing

### 7.1 Run Spark Container

```
1 docker run -it \
2   --name spark \
3   --network learntrack-net \
4   -p 4040:4040 \
5   bitnami/spark:3 \
6   bash
```

## 7.2 Execute Spark Job

The Spark job reads activities from MongoDB and writes aggregated engagement results into Cassandra.

```
1 spark-submit \  
2 --packages \  
3 org.mongodb.spark:mongo-spark-connector_2.12:10.3.0,\  
4 com.datastax.spark:spark-cassandra-connector_2.12:3.5.0 \  
5 /opt/spark/work-dir/spark_job.py
```

## 7.3 Verify Cassandra Results

```
1 SELECT * FROM learntrack.course_engagement;
```

# 8 Grafana Visualization

## 8.1 Run Grafana Container

```
1 docker run -d \  
2 --name grafana \  
3 --network learntrack-net \  
4 -p 3000:3000 \  
5 grafana/grafana
```

## 8.2 Access Grafana

<http://localhost:3000>

- Username: admin
- Password: admin

## 8.3 Dashboards

- Redis: student engagement scores
- Cassandra: course-level engagement analytics
- Neo4j: multi-region access detection

# 9 Conclusion

This document presented a complete and consistent setup of the LearnTrack Big Data platform, including Docker orchestration, Python-based data loading, batch analytics with Spark, and real-time visualization using Grafana.
